(Pocket-lint) - Twitter wants all users to change their passwords - and also for all other services that use the same password. So read this and change it! Like other companies, Twitter uses encryption to store passwords, so you can't get them. However, the company's IT bods recently identified a bug that unmasked passwords in internal logs. Yes, that means saving them in plain text. Twitter sounds like amateur time to us, but now we're saying, We've fixed the bug. Twitter says it is asking everyone to change their passwords out of an end of caution. The company said, Our investigation shows no signs of violation or misuse by anyone. We are very sorry that this has happened. We recognize and appreciate the trust you place in us and are committed to winning that trust every day. You may see a screen in the following screenshot asking you to change your password when you log in. If you don't want to set up Twitter, go to Settings and Privacy > Change Password on the Twitter website or Change your password in settings and privacy > Account >; mobile app. If you don't know what your password was, visit our password reset page. Always enable login verification (also known as two-factor authentication) for all accounts where possible. This is the only best action you can take to increase the security of your account - basically, it requires code from a second device (a device that is already logged in). You can also text the code. See the articles What is two-factor authentication? and Why use it? This article will also explain how to enable two-factor authentication for Apple, Google, Facebook, etc. Get a great Ivacy VPN for less in this awesome Christmas deal To register for two-factor authentication on Twitter, go to settings and privacy.Account. Then set up a login confirmation and enter your password when prompted. If you already have a mobile number registered on Twitter, you will be asked to verify your mobile number. After that, you will see the text of the code. When you enter it into an app or site, you're enrolled in two-factor authentication. Twitter also states that these other tips require you to use a strong password that you don't reuse on other websites (pretty obvious) and use a password manager to make sure you're using strong and unique passwords everywhere. This latter point is easier said than done. Password managers like LastPass work on some platforms and browsers, but not everything you use. Twitter says it masks passwords through a process called hashing, using a function called bcrypt that replaces real passwords with random sets of numbers and letters stored on Twitter's system. This allows Twitter's system to verify the credentials of the account without revealing the password. This is an industry standard. Rah Samani, chief scientist and fellow at security firm McAfee: See these tips for creating strong passwords. Do not use a family name, pet, birthday, 12345 or password. Many websites and apps ask you to include a combination of numbers, lowercase and uppercase letters, and symbols, which is for good reason. The harder it is to guess the password, the harder it is to crack. Use a unique password for each account. Today's hackers are smart and if one of your passwords is hacked, hackers are more likely to try to hack all of your accounts. Use different passwords to ensure that important information is protected across email, social media and bank apps. I forgot my password issue. Using the Forgot Password link as a fallback option in the Webmail service or other sites is not a smart move. Answers to questions asked to unlock accounts are often easily found on the social media profiles of yourself or your friends and family, and codes can be easily cracked for hackers. Use a password manager. All of the above are great, but how do you need to remember more than 20 unique passwords? Password manager helps you create complex and strong passwords and autosady them, so you don't have to remember each one. Double protection. Advances in fingerprint scanning and biometric technologies such as face and speech recognition are helping improve security. Using passwords in combination with other authentication techniques can help protect your device and data. Did you like this? check out Twitter tips for beginners writing by Dan Grabham. By setting your Apple iPhone password by Adrian Graham, you can protect your data and prevent unauthorized calls if your phone is lost or stolen. Those who try to use an iPhone should enter the correct password called iPhone passcode as soon as they switch on or wake up.Changing your passcode regularly is a sensible security measure to prevent unauthorized access to your iPhone. Change the passcode from the Settings menu on your Apple iPhone. Turn on the Apple iPhone. On your iPhone's display screen, tap Select Settings, followed by General and Passcode Lock. When prompted, enter your current passcode. The Passcode Lock settings page appears. Tap the Change passcode option on the screen. In the Enter Old Passcode dialog box, type the current four-digit passcode. Enter a new 4-digit passcode, and when prompted to confirm your new password, re-enter it. This will bring up the Passcode Lock settings page again. Read the other options and select the settings in the drop-down menu and sliders. You can choose how long it will take for your iPhone to need to enter a passcode. On the main menu bar, click Personal Information > Change Account > Password to change your password. The following guidelines can help you create passwords that are difficult for others to find. Passwords are not distinguished from at least one character long for 8 to 12 characters, . _ ? , & amp; #, or lspace for one number, and user IDs should not use explicit words such as your name, child or spouse's name, phone number, or date of birth. If you register a password in uppercase or all uppercase letters, enter all upper or lower case when you log in. If you want to register with a combination of upper and lower case letters, enter the exact password when you log in. Change the old password for the password - Enter the current password to verify your identity. New Password - Follow the steps above to enter 8 to 12 characters of the new password. Check for new passwords - Re-enter the new password, and then click Update to record the changes. Note - If you change your password and have an email address associated with your account, you will receive an email notification about your account change/activity. Nick Ferrari with reader digest I was having a great morning until I sat in front of the computer in my office. My password has expired, a server message flashed on the screen with instructions for changing it. Come up with a new code is no big deal as long as you work for my company and you have to change it every month using at least one uppercase letter, one lower case, one symbol, and one number. Oh, and the whole dern thing can't be less than eight characters. And I can't use the same password I've used in the last 3 months. Suddenly, I was furious. What didn't get any better than that was that after my recent divorce, I was deeply depressed. The distrust of what she had done to me was all I thoughtEvery day. This didn't mean anything to an empty input field with a pulsating cursor, so I waited for the next 30 days to enter the password that I had to enter many times. I remembered a tip I heard from my former boss. He said, I'm going to use a password to change my life. I couldn't focus on getting things done in my current mood. There was a clear indicator of what I needed to do to regain control of my life, but I couldn't care less about them. My password became an indicator. My password was a good thing that I myself shouldn't be the victim of my recent farewell and that I'm strong enough to do something about it. I made my password . I had to type this sentence several times a day. Every time my computer is locked. Every time you see my screensaver and a picture of her. Every time I ate lunch by my hand and came back. In my mind, I wrote to forgive her every day. Simple actions have changed the way I look at my former wife. Memories of that constant reconciliation have resulted in me accepting what happened at the end of my marriage and accepting new ways of dealing with my depression. As the months passed, I felt that slow healing would begin to occur. By the time I prompted the server to reset my password the following month, I felt free. A month later, my dear Exchange server asked me to reset my password again. I thought about what I had to do next. I stop smoking overnight because my password became . This password was painful to enter during the month, but doing it helped me yell myself in my mind as I entered that statement. It motivated me to follow my monthly goals. A month later, my password became . Guess where I went after 3 months: Thailand. Seeing how these reminders helped me realize my goals kept me motivated and excited. Sometimes it's hard to come up with the next goal, but keeping it up can have great results. Here's a quick excerpt of what some of my passwords have been in the last two years, so thanks to this method you get an idea of how my life has changed: copyright © 2014 by Mauricio Estrella.
